Loggly: Search, Visualize, and Analyze Your Log Data Across the Stack

Hosted, managed, parsed, and summarized log data—investigate quickly and reduce your MTTR.
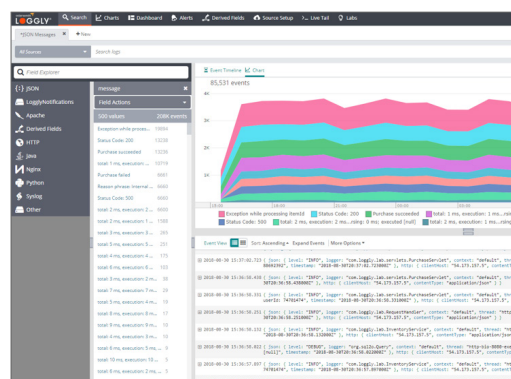

With SolarWinds® Loggly®, you gain real-time visibility across machine data from any source. Our cloud-based service automatically structures and summarizes this data and connects it to the corresponding source code as well as to the tools your team uses every day.
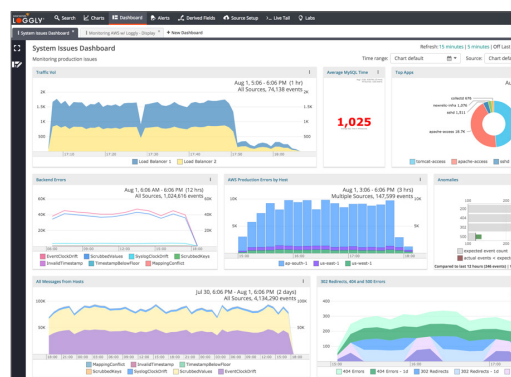

FEATURES

Monitor everything that matters. Send logs and metrics from multiple sources—no proprietary agents required. Monitor, analyze, and optimize applications running on dynamic infrastructures, hybrid clouds, microservices, devices, and IoT. Understand performance and identify root causes with data from the full stack and third-party services.

Investigate using high performance interactive searching over massive data volumes and long time periods. The Dynamic Field Explorer™ provides a structured summary of all your parsed logs—it's like a map of your data. View surrounding events that occurred just before or after critical events across the entire distributed stack. Use Loggly Live Tail to see all of your logs across all of your systems in real time.

Analyze and visualize your data to answer key questions, spot trends, and track SLA compliance. Create charts for log event counts, averages, percentiles, and more. Filter your log data and use structured, unstructured, and semi-structured log data to create charts. Build dashboards from many charts to fit your precise monitoring needs. Use preconfigured dashboards for many popular technologies.

loggly

Collaborate throughout the software lifecycle and send Loggly alerts to PagerDuty®, Slack®, or HipChat® or use any webhook-compatible notification service. Integrate with GitHub®, where Loggly links your logs directly to the corresponding file and line in your source code and view recent commits. Create Jira® tickets with a single click based on specific log data from within Loggly.
